Report No. 5."

MAUNA LOA CARBON DIOXIDE PROJECT*

REPORT NO. 5

Prepared by

C.A. Ekdahl, P. Guenther, J.L. Riley
and C.D. Keeling

SCRIPPS INSTITUTION OF OCEANOGRAPHY

A Summary of Reference Gas Analyses with Infrared Analyzer APC No. 58 at Mauna Loa Observatory from January 1971 through December 1972 together with Analyses of Atmospheric Carbon Dioxide from January 1971 through December 1972

American Society for Information Science
Document

*Financial Support from the Atmospheric Sciences Section of the U.S. National Science Foundation under Grants GA-13645, GA-13839, and GA-31324X

I. Introduction

This report documents the observation of atmospheric carbon dioxide at Mauna Loa Observatory, Hawaii for the period beginning with January 1, 1971 and ending on December 31, 1972. Earlier results are covered in four previous reports.⁽¹⁾ Experimental methods have remained unchanged since described by Pales and Keeling.⁽²⁾ The data and results of computations are assembled in tables which follow this text. These tables are numbered in the same manner as in Mauna Loa Report No. 4 and a detailed description of the entries and calculations involved may be found in that report.

In summary, Tables 1 through 7 contain detailed information relating to the calibration of the non-dispersive analyzer; Tables 8 through 10, the observed CO₂ concentrations; and Tables 11 through 13 relate to comparisons of the flask sampling program with the continuous analyzer.

II. Chronology of Calibration Periods

For the purposes of calibration, the period covered by the report is divided into 10 distinct intervals. For each of these intervals a linear variation of instrumental sensitivity with time was determined as described in Report No. 4. The chronology of these intervals is next discussed. The intervals are numbered in a continuation of the scheme initiated with Report No. 4.

The first interval of this report (interval number 19) begins on January 1, 1971 and ends on May 31, 1971, the day before the Mauna Loa Observatory technician changed the detector polarizing voltage. Period 20 begins on June 1, 1971, the day on which the polarizing voltage was changed, and ends on June 23, 1971, the day before the MLO technician replaced the thermal control cutout switch. Period 21 begins on the day the switch was replaced (June 24, 1971) and ends on July 11, 1971, on which date the analyzer failed entirely. This period was characterized by a rapidly varying recorder scale factor. The next period (number 22) begins on July 12, 1971 when the entire thermal control unit was replaced, and ends with the failure of the analyzer, on July 26, 1971. The analyzer was out of commission from July 27 through August 1, and period 23 begins on August 2, 1971, when the Brown recorder amplifier vibrator was replaced and ends on October 6, 1971 when SIO personnel (C. A. Ekdahl and D. J. Moss) arrived to repair the analyzer. The analyzer was out of commission from October 7 through October 11 during which time it was moved back into the main building to alleviate extreme temperature problems. The original tank handling system (use of two regulators only) has been in use since this visit. Period 24 begins on October 12, 1971 and ends on June 5, 1972. The ending date of this period is the last calibration date prior to a definite change in instrumental sensitivity. The next period (25) begins on June 6, 1972 and ends on July 23, 1972, on which date SIO personnel (D. J. Moss) begin overhaul of analyzer. The analyzer was out of commission July 24 through July 25 while it was

being worked on and on July 26, 1972 period number 26 begins and runs through September 19, 1972, which was the date of the last work performed on the analyzer prior to the Mauna Loa technician's noticing that "someone" had changed the span setting. Period 27 begins the day after this work (September 20, 1972) and ends on September 24, 1972, which is the day prior to the MLO technician returning the span setting to its original value. The last period (number 28) begins on the date the span was reset (September 25, 1972) and ends on the last date covered in this report, December 31, 1972.

III. Calibration runs rejected during 1971 - 1972

The following calibrations were rejected as a result of improper procedures being followed. These runs are tabulated in Table 1, but RSF calculations (Table 2) do not include them.

The triangle computed RSF on Februray 9, 1972 was rejected as a result of a suspected problem with the surveillance tank line evident on the chart traces. All calibration runs made on February 23, 1972 were rejected because they were performed immediately after working on the analyzer, without allowing sufficient time for the analyzer to come to operating temperature and stabilize. During November and December of 1972 there was an apparent comtamination problem, as revealed by the chart traces in calibration dates. As a result several calibration runs were rejected during this period. The calculated triangle was omitted for November 1, December 8, and December 14, and all calibrations were rejected for November 7 and November 9, 1972.

61

(The Recorder Scale Factor is related to the sensitivity by the equation:

$$\text{RSF (ppm/scale div.)} = [(t - t_o)K + S_o]^{-1}$$

where t is measured in days referred to 1 JAN 58)
